

WHAT IS CLAIMED IS:

1. A combining device for tightly fixing a screen to a wall; the screen being suspended from a rod body so that the screen is expanded by the rod body and thus shields an area defined by the rod body; the combining
5 device comprising:

a female combining unit having a folding line; the folding line dividing the male combining unit into two parts, a first part and a second part; the first part of the male combining unit being turnable; the second part of the female combining unit being adhered to the screen; a sticky
10 strip being adhered on the male buckle wherein the male combining unit is foldable along the folding line so that the turning portion uprights from a surface of the screen;

a male combining unit adhered to a wall by using an adhering sheet; wherein the male combining unit is capable of being adhered to a wall
15 through the adhering sheet;

wherein a width of the second part is approximately equal to the total widths of the male combining unit and the adhering sheet; the sticky strip of the turning portion can be combined to one surface of the female combining unit as the turning portion is turned from the folding line; so
20 that when the male combining unit is combined to the female combining unit, the screen is tightly adhered to the wall.

2. The combining device for tightly fixing a screen to a wall as claimed in claim 1, wherein the sticky strip is a double face tape.
